... Automatic Entrance Doorset ...

The connect a.d. Hinging Automatic Entrance Doorset with Low Energy Operator is ideal for low to medium volume traffic and disabled access in commercial environments. The standard profile frame option is the most popular and cost-effective when providing automation for disabled access.

The basic doorset comprises a doorleaf and frame constructed from a standard aluminium profile, supplied in single leaf, leaf-and-a-half or double leaf, and as a complete entrance system with sidescreens and transom panels.

All complete doorsets are polyester powder coated to any BS or RAL colour, with Satin & Bronze Anodised finishes and Stainless Steel also available. Door or handle colours should contrast surrounding colours to aid those with visual impairment.

Glazing options include single or double glazing in clear laminate, toughened, tinted or reflective glass, with solid non-transparent panels and louvre panels available. Vinyl graphics and manifestation can provide customisation.

For disabled access, stainless steel push plates are the most common activation method. The push plates are either hard wired or battery operated and can be wall or post mounted. Covers include:

The operator self closes after an adjustable time delay and incorporates an anti-crush facility. As a result of controlled opening and closing speeds (typically 4.5-6.5 seconds) and limited operating forces, no additional safety equipment is required to meet British Standard BS 7036.

The Residential operator is suitable for low volume use. Power closing and battery backup are standard.

The Commercial 'push & go' operator is most suitable for trained traffic areas, e.g. offices. It powers open when the door is physically pushed or pulled.

The Commercial 'manual movement' operator is a conventional door closer and is ideal for general access.

Optional activation and features include:

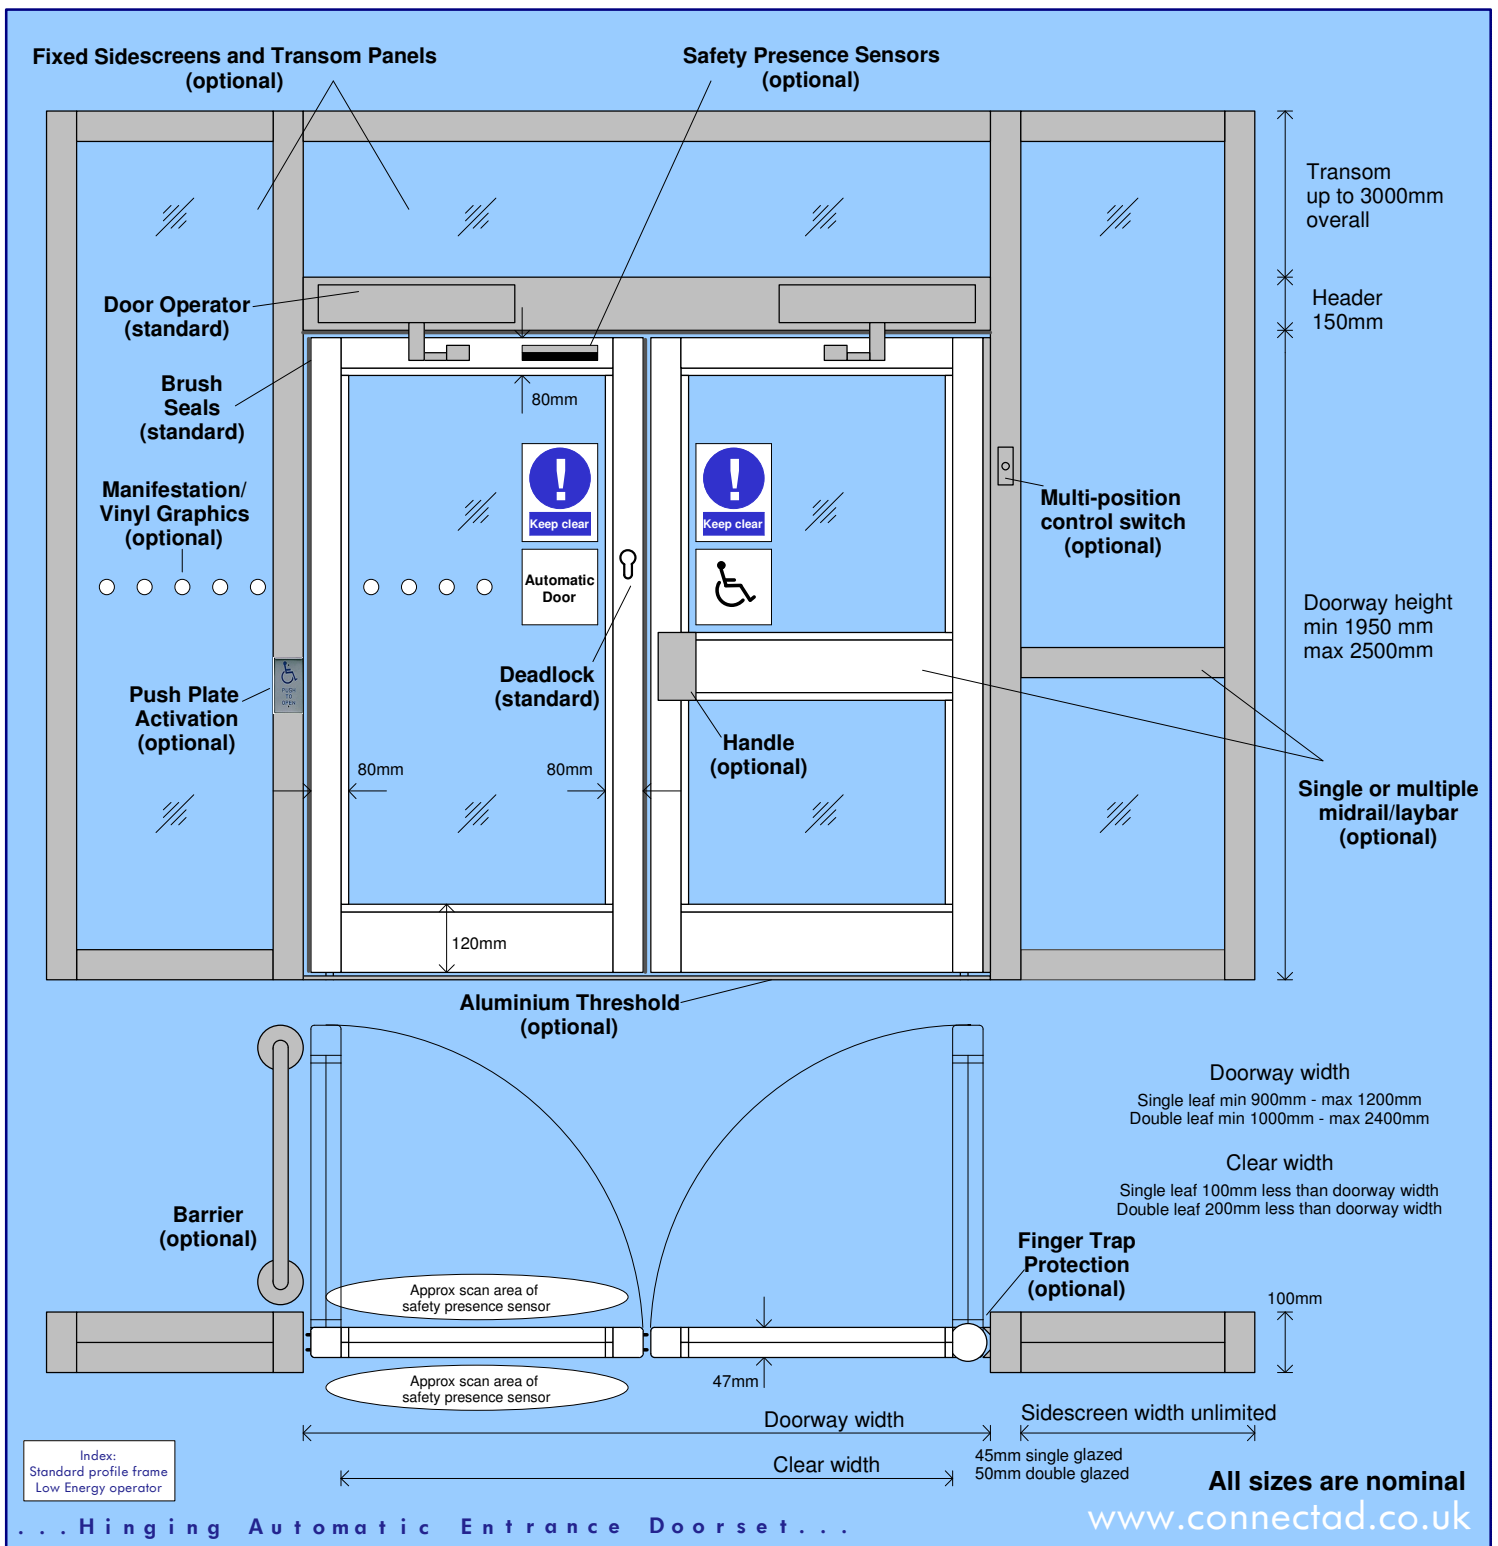

- Overhead sensor or remote control activation
- Integration to an electric strike or magnetic lock
- Activation signal from a remote fire alarm
- Multi-position control switches
- Aluminium, powder coated and stainless steel handles
- Finger trap protection
- Safety upgrades incl. barriers & presence sensors
- Battery backup for the 'push & go' operator

Manufactured and Installed by connect a.d. at a Pharmacy, incorporating the Commercial 'manual movement' operator
